

# Q3 2018

Quarterly Market Review

# Quarterly Market Review

Third Quarter 2018

This report features world capital market performance and a timeline of events for the past quarter. It begins with a global overview, then features the returns of stock and bond asset classes in the US and international markets.

The report also illustrates the impact of globally diversified portfolios and features a quarterly topic.

## Overview:

## Executive Summary

“Recency bias” describes our tendency to overemphasize the impact of recent events, which often leads to incorrect or short-sighted conclusions. ***Our investment philosophy naturally removes recency bias because it is centered around investing for the long term.*** One of our primary investment principles is designing a globally diversified portfolio. At any given time, however, certain regions, such as the United States, will perform better than others, but forecasting which regions will outperform is difficult. For example, while the US markets have done particularly well post-2008 relative to international markets, they lagged for a full decade previously. Thus, we believe it is optimal to maintain a diversified global portfolio.

The third quarter of 2018 saw low unemployment, climbing inflation, and strong economic growth. As a result, the Federal Reserve continued its interest rate hike trajectory, slowly weaning the economy off monetary stimulus. Risk assets had a strong quarter, with US equity markets returning +7.7% and global equity markets returning +4.4%. The US versus international stocks spread continued to widen, and outperformance year-to-date is now over 13%. ***While it may be tempting to chase returns in the higher returning market, these divergences over the past few decades have been cyclical, and we recommend maintaining a globally diversified portfolio.***

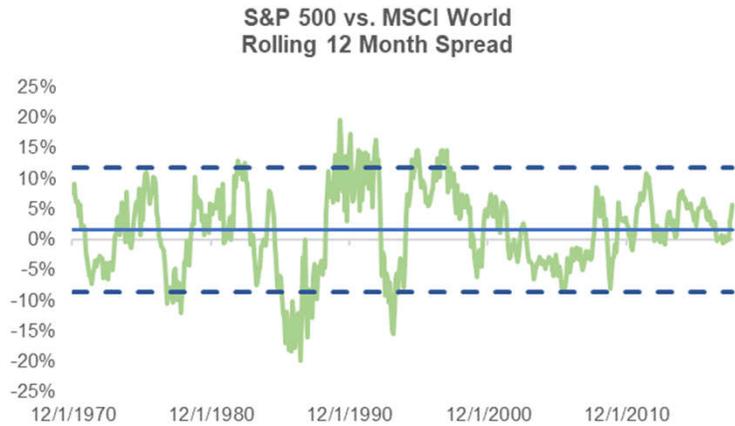

Risk Type	Asset Class	Asset	QTD	YTD	1-Yr
Risk Asset	Equities	MSCI ACWI	4.4%	4.2%	10.4%
		S&P 500 Index	7.7%	10.6%	18.0%
		MSCI ACWI ex-US Index	0.8%	-2.7%	2.3%
		MSCI EAFE Index	1.4%	-1.0%	3.3%
		MSCI Emerging Markets Index	-1.0%	-7.5%	-0.5%
		MSCI AC Asia Pacific Index	0.6%	-2.6%	5.5%
	Commodities	S&P GSCI TR Index	1.3%	11.8%	23.0%
		WTI Crude Oil TR Index	2.6%	28.1%	48.7%
Risk Mitigator	Fixed Income	Barclays Agg Index	0.0%	-1.6%	-1.2%
		Muni Bond Index	-0.2%	-0.6%	0.1%
		Barclays US Treasury TR Index	-0.6%	-1.7%	-1.6%
		Barclays TIPS Index	-0.8%	-0.8%	0.4%

### Quarterly Commentary: US vs. International Markets

One of the most notable trends this year has been the widening outperformance of US stocks versus their international peers. After a volatile beginning to the year due to concerns over inflation, rate hikes, and trade wars, the S&P 500 surged over 7.7% in Q3, significantly outperforming non-US stocks and emerging markets<sup>1</sup>. Indeed, this trend has persisted for nearly the entire post-2008 bull market<sup>1</sup>. Globally diversified clients have occasionally asked if they should pivot to a full US portfolio because of this outperformance. We caution otherwise.

It is natural to gravitate towards the best-performing parts of the market. Indeed, there is a factor called “momentum” built around the very concept that previous winners will continue winning. Fundamentally, however, it does not make sense for the US to outperform the rest of the world indefinitely. The price to earnings ratio for US vs. non-US stocks continues to widen, which means US stocks are increasingly more expensive<sup>III</sup>. According to Bank of America Merrill Lynch, the premium for US vs. global stocks is at its highest since 2009<sup>IV</sup>. Historically, these deviations have been cyclical. For example, US stocks underperformed global stocks for a full two decades after 1970<sup>V</sup>.

Source: Bloomberg

Source: World Bank

We would also like to note that the rest of the world, on average, tends to grow faster than the United States. The US remains the world’s strongest economy with the best higher education institutions and intellectual property, which means the rest of the world has the natural tailwind of copying what has worked in the US and growing off a smaller base. Over time, the US share of global GDP has fallen and should continue to do so. Global diversification means exposure to these economic trends. While GDP and market growth are not always correlated, saliently illustrated by China’s decoupling of GDP growth versus market returns<sup>VI</sup>, they are fundamentally related over the long run.

Economic growth is best facilitated by maturing financial markets, which means implementing a system that allows for stable investing. Over time, global market diversification means participating in economic progress. ***Thus, from both a valuation and fundamental perspective, we recommend maintaining a globally diversified portfolio.***

### **Enjoying Your Wealth**

We find it critical that you are well-informed about what is happening in your portfolio because it sets realistic expectations that allows for disciplined long-term investing. The reality is that market variance is unavoidable, which has led many an investor throughout history to overreact because of short-term fluctuations.

Not only is understanding the context of your performance important for long-term financial growth, it is also essential to enjoying your wealth. *In his book Solve For Happy, Chief Business Officer at Google X Mo Gawdat expresses happiness as the following equation:*

***Happiness  $\geq$  Your PERCEPTION of the EVENTS of your life – Your EXPECTATIONS of how life should behave***

In other words, if your perception of events is equal to or greater than your expectations, then you are at least not unhappy. Unfortunately, we cannot control global events to the magnitude that we'd like, but we do have some control over *perception* and *expectations*<sup>vii</sup>.

This is precisely why we use an evidence-based investment philosophy. We are able to block out short-term noise, allow markets to work for us, and share insights with clients that help them *perceive events* through a historical lens and set reasonable *expectations* in both periods of underperformance and outperformance. ***We believe that this approach is the optimal way to help you grow and enjoy your wealth as we walk through life together.***

### **Organizational Updates**

As many of you are already aware, there have been changes to WealthStone's investment and leadership team over the past quarter. Norm Cook joins WealthStone as the new President & CEO, Lee Caleshu joins as the new Chief Investment Officer, and Jack Zhang joins as the Managing Director of Research and Risk Management. These changes were implemented to better serve you. WealthStone has served clients for over forty years, and these changes are intended to ensure that we can best serve you for the next forty.

We are excited to be working together and continue to utilize an evidence-based investment process. Please reach out to schedule a meeting with us, and we will be happy to introduce you to the new team. We are here to serve you and thank you for your trust.

---

<sup>i</sup> In Q3, the MSCI ACWI ex-US returned +0.8%, and MSCI Emerging Markets Index returned -1.0%

<sup>ii</sup> Over the past 10 years, the S&P 500 is up +12% annually versus 8.8% for the MSCI ACWI and 5.7% for the MSCI ACWI ex-US

<sup>iii</sup> Trailing P/E ratio for the S&P 500 is at 21.1x versus 14.7x for non-US stocks.

<sup>iv</sup> <https://www.wsj.com/articles/u-s-stocks-widen-lead-over-rest-of-the-world-1538386227>

<sup>v</sup> From January-1970 to January-1990, the S&P 500 underperformed the MSCI World.

<sup>vi</sup> China average annual GDP growth since 1992 has been approximately 9.7% versus 1.5% for the MSCI China Index.

# Total Cost of Ownership

Third Quarter 2018

Costs matter. Whether you're buying a car or selecting an investment strategy, the costs you expect to pay are likely to be an important factor in making any major financial decision.

People rely on a lot of different information about costs to help inform these decisions. When you buy a car, for example, the sticker price indicates approximately how much you can expect to pay for the car itself. But the costs of car ownership do not end there. Taxes, insurance, fuel, routine maintenance, and unexpected repairs are also important considerations in the overall cost of a car. Some of these costs are easily observed, while others are more difficult to assess. Similarly, when investing in mutual funds, different variables need to be considered to evaluate how cost-effective a strategy may be for a particular investor.

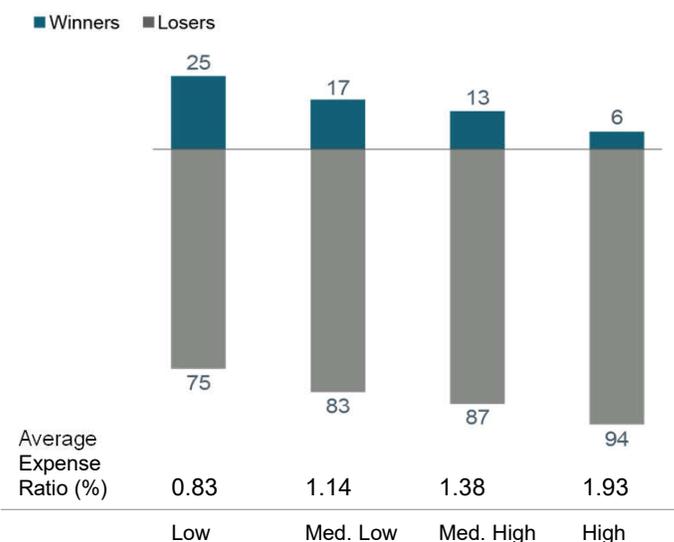

## EXPENSE RATIOS

Mutual funds have many costs, all of which affect the net return to investors. One easily observable cost is the expense ratio. Like the sticker price of a car, the expense ratio tells you a lot about what you can expect to pay for an investment strategy. Expense ratios strongly influence fund selection for many investors, and it's easy to see why.

**Exhibit 1** illustrates the outperformance rate, or the percentage of funds that beat their category index, for active equity mutual funds over the 15-year period ending December 31, 2017. To see the link between expense ratio and performance, outperformance rates are shown for quartiles of funds sorted by their expense ratio. As the chart shows, while active funds have mostly lagged indices across the board, the outperformance rate has been inversely related to expense ratio. Just 6% of funds in the highest expense ratio quartile beat their index, compared to 25% for the lowest expense ratio group.

This data indicates that a high expense ratio presents a challenging hurdle for funds to overcome, especially over longer time horizons. From the investor's point of view, an expense ratio of 0.25% vs. 1.25% means savings of \$10,000 per year on every \$1 million invested. As **Exhibit 2** helps to illustrate, those dollars can really add up over time.

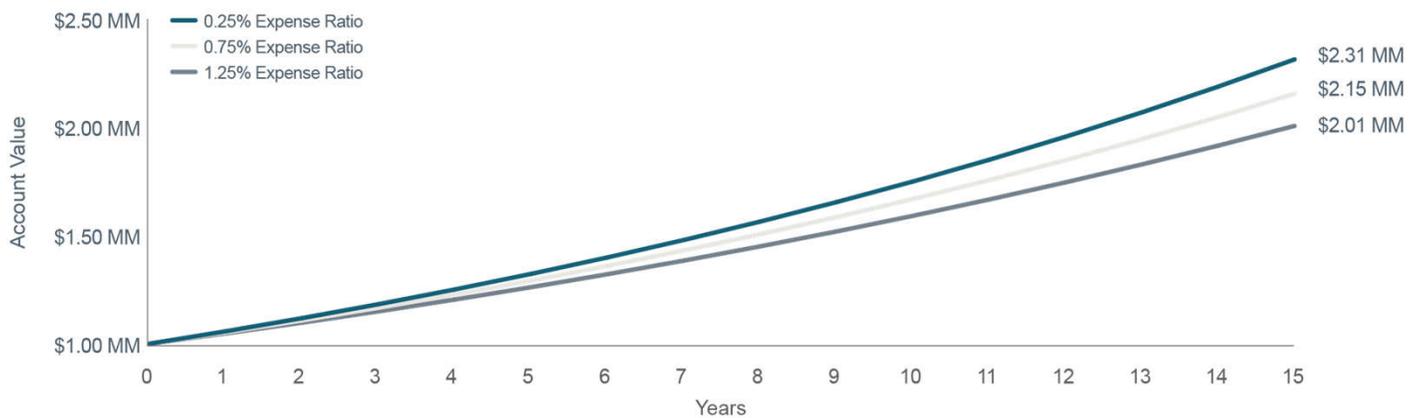

Exhibit 1. High Costs Can Reduce Performance, Equity Fund Winners and Losers Based on Expense Ratios (%)

*The sample includes funds at the beginning of the 15-year period ending December 31, 2017. Funds are sorted into quartiles within their category based on average expense ratio over the sample period. The chart shows the percentage of winner and loser funds by expense ratio quartile; winners are funds that survived and outperformed their respective Morningstar category benchmark, and losers are funds that either did not survive or did not outperform their respective Morningstar category benchmark. US-domiciled open-end mutual fund data is from Morningstar and Center for Research in Security Prices (CRSP) from the University of Chicago. Equity fund sample includes the Morningstar historical categories: Diversified Emerging Markets, Europe Stock, Foreign Large Blend, Foreign Large Growth, Foreign Large Value, Foreign Small/Mid Blend, Foreign Small/Mid Growth, Foreign Small/Mid Value, Japan Stock, Large Blend, Large Growth, Large Value, Mid-Cap Blend, Mid-Cap Value, Miscellaneous Region, Pacific/Asia ex-Japan Stock, Small Blend, Small Growth, Small Value, and World Stock. For additional information regarding the Morningstar historical categories, please see "The Morningstar Category Classifications" at [morningstardirect.morningstar.com/clientcomm/Morningstar\\_Categories\\_US\\_April\\_2016.pdf](http://morningstardirect.morningstar.com/clientcomm/Morningstar_Categories_US_April_2016.pdf). Index funds and fund-of-funds are excluded from the sample. The return, expense ratio, and turnover for funds with multiple share classes are taken as the asset-weighted average of the individual share class observations. For additional methodology, please refer to Dimensional Fund Advisors' brochure, Mutual Fund Landscape 2018. Past performance is no guarantee of future results.*

# Total Cost of Ownership

Exhibit 2. Hypothetical Growth of \$1 Million at 6%, Less Expenses

*For illustrative purposes only and not representative of an actual investment. This hypothetical illustration is intended to show the potential impact of higher expense ratios and does not represent any investor's actual experience. Assumes a starting account balance of \$1 million and a 6% compound annual growth rate less expense ratios of 0.25%, 0.75%, and 1.25% applied over a 15-year time horizon. Performance of a hypothetical investment does not reflect transaction costs, taxes, other potential costs, or returns that any investor would have actually attained and may not reflect the true costs, including management fees, of an actual portfolio. Actual results may vary significantly. Changing the assumptions would result in different outcomes. For example, the savings and difference between the ending account balances would be lower if the starting investment amount were lower.*

## GOING BEYOND THE EXPENSE RATIO

The poor track record of mutual funds with high expense ratios has led many investors to select mutual funds based on expense ratio alone. However, as with a car's sticker price, an expense ratio is not an all-encompassing measure of the cost of ownership. Take, for example, index funds, which often rank near the bottom of their peers on expense ratio.

Index funds are designed to track or match the components of an index formed by an index provider, such as Russell or MSCI. Important decisions in the investment process, such as which securities to include in the index, are outsourced to an index provider and are not within the fund manager's discretion. For example, the prescribed reconstitution schedule for an index, which is the process of deleting or adding certain stocks to the index, may cause index funds to buy stocks when buy demand is high and sell stocks when buy demand is low. This price-insensitive buying and selling may be required so that the index fund can stay true to its investment mandate of

tracking an underlying index. This can result in suboptimal transaction prices for the index fund and diminished overall returns. In other words, for a given amount of trading (or turnover), the cost per unit of trading may be higher for such a strictly regimented approach to investing. Moreover, this cost will not appear explicitly to investors assessing such a fund on expense ratio alone. Further, because indices are reconstituted infrequently (typically once per year), funds seeking to track them may also be forced to buy and sell holdings based on stale eligibility criteria. For example, the characteristics of a stock considered a value stock<sup>1</sup> as of the last reconstitution date may change over time, but between reconstitution dates, those changes would not affect that stock's inclusion or weighting in a value index. That means incoming cash flows to a value index fund could actually be used to purchase stocks that currently look more like growth stocks<sup>2</sup> and vice versa. Metaphorically, these managers' attention may be more focused on the rear-view mirror than on the road ahead for investors.

1. A stock trading at a low price relative to a measure of fundamental value, such as book value or earnings.

2. A stock trading at a high price relative to a measure of fundamental value, such as book value or earnings.

# Total Cost of Ownership

For active approaches like stock picking, both the total amount of trading and the cost per trade may be high. If a manager trades excessively or inefficiently, costs like commissions and price impact from trading can eat away at returns. Viewed through the lens of our car analogy, this impact is like the toll on your vehicle from incessantly jamming the brakes or accelerating quickly. Subjecting the car to such treatment may result in added wear and tear and greater fuel consumption, increasing your total cost of ownership. Similarly, excessive trading can lead to negative tax consequences for a fund, which can increase the cost of ownership for investors holding funds in taxable accounts. Such trading costs can be reduced by avoiding unnecessary turnover and seeking to minimize the cost per trade.

In contrast to both highly regimented indexing and high-turnover active strategies, employing a flexible investment approach that reduces the need for immediacy, and thus enables opportunistic execution, is one way to potentially reduce implicit costs. Keeping turnover low, remaining flexible, and transacting only when the potential benefits of a trade outweigh the costs can help keep overall trading costs down and help reduce the total cost of ownership.

## CONCLUSION

The total cost of ownership of a mutual fund can be difficult to assess and requires a thorough understanding of costs beyond what an expense ratio can tell investors on its own. We believe investors should look beyond any one cost metric and instead evaluate the total cost of ownership of an investment solution.

Index performance does not reflect the expenses associated with the management of an actual portfolio. Commodities returns represent the return of the Bloomberg Commodity Total Return Index. Individual commodities are sub-index values of the Bloomberg Commodity Total Return Index. Data provided by Bloomberg.

# Fixed Income

## Third Quarter 2018 Index Returns

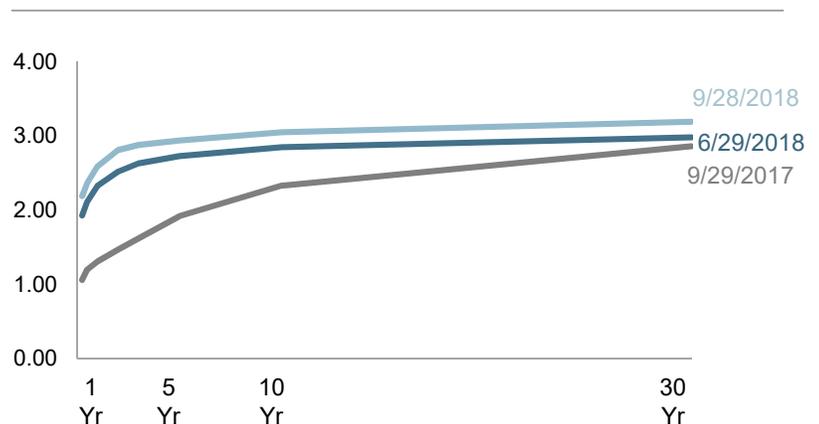

Interest rates increased in the US during the third quarter. The yield on the 5-year Treasury note rose 21 basis points (bps), ending at 2.94%. The yield on the 10-year Treasury note increased 20 bps to 3.05%. The 30-year Treasury bond yield rose 21 bps to 3.19%.

On the short end of the yield curve, the 1-month Treasury bill yield increased 35 bps to 2.12%, while the 1-year Treasury bill yield rose 26 bps to 2.59%. The 2-year Treasury note yield finished at 2.81% after an increase of 29 bps.

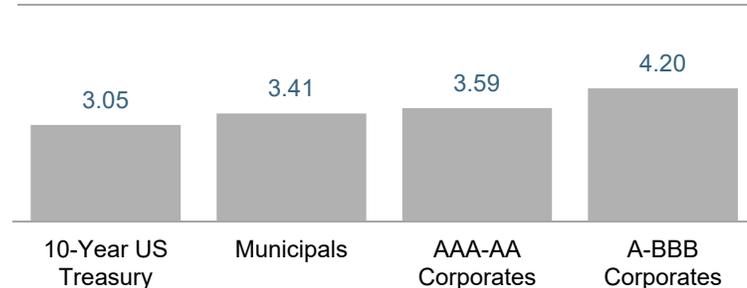

In terms of total return, short-term corporate bonds gained 0.71%, while intermediate-term corporates returned 0.80%.

Short-term municipal bonds declined 0.11%, while intermediate-term munis dipped 0.06%. Revenue bonds (-0.16%) performed in line with general obligation bonds (-0.14%).

# Impact of Diversification

## Third Quarter 2018 Index Returns

These portfolios illustrate the performance of different global stock/bond mixes and highlight the benefits of diversification. Mixes with larger allocations to stocks are considered riskier but have higher expected returns over time.

### Ranked Returns (%)

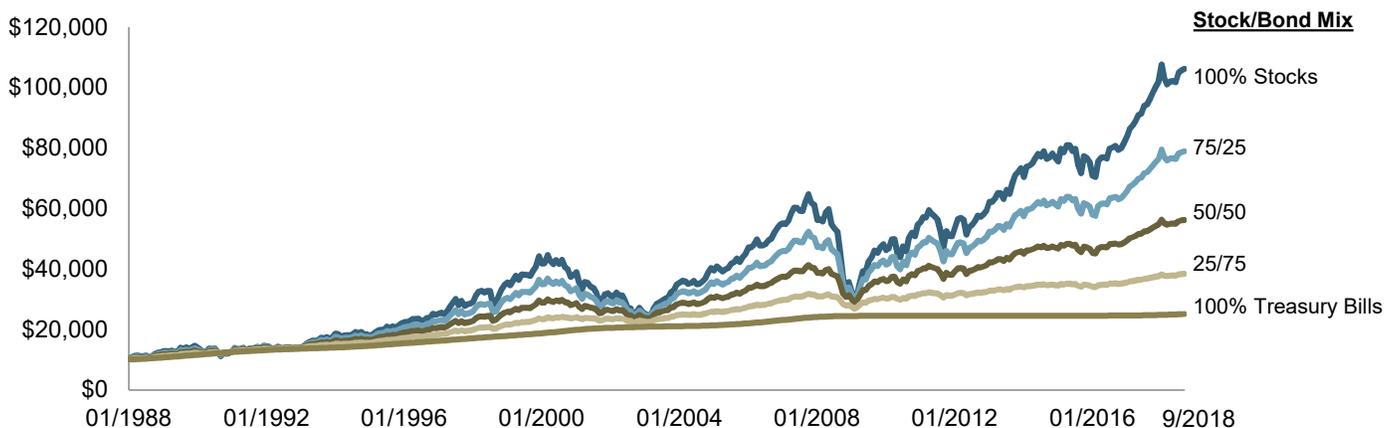

### Period Returns (%)

100% Treasury Bills	1.24	1.50	0.75	0.45	0.27	0.14

## Growth of Wealth: The Relationship between Risk and Return

1. STDEV (standard deviation) is a measure of the variation or dispersion of a set of data points. Standard deviations are often used to quantify the historical return volatility of a security or portfolio.

Diversification does not eliminate the risk of market loss. **Past performance is not a guarantee of future results. Indices are not available for direct investment. Index performance does not reflect expenses associated with the management of an actual portfolio.** Asset allocations and the hypothetical index portfolio returns are for illustrative purposes only and do not represent actual performance. Global Stocks represented by MSCI All Country World Index (gross div.) and Treasury Bills represented by US One-Month Treasury Bills.
